# O 'Git Push' envia tudo que esta no repositório local para o repositório remoto

FUN  
CA  
BA

The screenshot displays a Windows desktop environment. At the top, a Git GUI window is open, showing the 'Current repository' as 'HTML-PETS-' and the 'Current branch' as 'main'. It indicates that the origin was last fetched 24 minutes ago. The 'Changes' tab shows 'Create pets.html' as the only change, committed by GabrielSouzaArcane 1 hour ago. The 'History' tab shows the same commit. The main area displays the content of 'pets.html', which is an HTML document with a title 'Seja Bem Vindos a <i>PETS</i></h1>', a paragraph about a Labrador retriever, and a list of breeds: 'Labrador retriever' and 'Labrador'. Below the GUI, a terminal window titled 'MINGW64/c:/Users/Aluno/Documents/repositório Gabriel/git bash prática' is open. It shows the user 'Aluno@SPROARF025' attempting to push the 'main' branch to the remote repository. The first push fails with the error 'error: src refspec main does not match any' and 'error: failed to push some refs to 'readme.md''. The second push fails with the error 'fatal: The current branch master has no upstream branch. To push the current branch and set the remote as upstream, use git push --set-upstream origin master'. The third push also fails with the same error. The terminal shows the user's command history and the output of the 'git push' command.
